Fictional complete report example

**Anaya (fictional) and Dev
(fictional)**

Prepared 15 October 2026

Language: English

Read this sample first

FICTIONAL LAYOUT SAMPLE.

Names, birth details, chart positions, scores, and dates below are invented for display testing. They are not an independently calculated personal report or a prediction.

Your results - the short version

Ashtakoot is an eight-category traditional matching method. The saved score for Anaya (fictional) and Dev (fictional) is 8 of 36; Varna is one scoring category, not a judgement of either person.

**SAVED PEOPLE**

Selected people: Anaya (fictional) and Dev (fictional).
The calculation is bound to both people.

EIGHT-FACTOR MATCHING TOTAL

Eight-factor matching total: 8 of 36 traditional points. This is not a relationship-success percentage.

ZERO-POINT FACTORS

Zero-point factors: none in this calculation.

FULL-WEIGHT FACTORS

Factors receiving their full individual weight: varna.

Where to look next

CALCULATED

Anaya (fictional) and Dev (fictional) have 8 of 36 traditional Ashtakoot points across eight categories.

TRADITIONAL READING

This is not a relationship-success percentage or a measure of care.

EXAMPLE

An illustrative couple discusses where to live and how to visit family.

YOUR NEXT CHECK

What agreement can both people make in their own words?

Find the full evidence: Read the eight-factor breakdown, not only the total. Use the separate priorities and discussion plan to consider actual consent, everyday compatibility and family expectations. No pass/fail marriage verdict is inferred.

Your question, in your own words

Prepared for Anaya (fictional) and Dev (fictional).

Question: What should we discuss before deciding where to live?

Keep this question in view as you read the calculated result and decide what to check in daily life.

For the decision you described

Keep the question above in view; no predefined topic has been assigned to it. These themes come from your request, not a concern discovered from a chart.

The factors compare the supplied birth records. They do not measure how these two people share care, money, travel or consent. Those answers must come from both people, not from the point total.

Facts to check before deciding:

- ◆ Selected people: Anaya (fictional) and Dev (fictional).
- ◆ Saved Ashtakoot result: 8 of 36 traditional points; 8 returned factors.
- ◆ Next fact to confirm: What does each person say the main disagreement is, and which one agreement would help first?

CHAPTER 01

Two people - one calculation, not a verdict

This saved calculation concerns Anaya (fictional) and Dev (fictional). The eight Ashtakoot categories add to 8 of 36 traditional points.

The total is not a chance of a successful marriage, a mental-health assessment or a measure of either person's worth. Traditions may use different summary labels; a label is not a fact about this relationship.

In this chapter

See every factor, not only the total

Varna - 1 of 1 points

Vashya - 1 of 2 points

Tara - 1 of 3 points

Yoni - 1 of 4 points

Graha Maitri - 1 of 5 points

Gana - 1 of 6 points

Bhakoot - 1 of 7 points

Nadi - 1 of 8 points

How the total was assembled

Use the discussion questions together

When a report is not the right tool

See every factor, not only the total

Each bar compares awarded points with that factor's own maximum. It shows the method weight, not the factor's importance in daily life or a chance of relationship success.

Eight returned factors and their own maxima

Awarded traditional points / possible points for that factor. Each row has its own scale; bars do not predict relationship success.

Varna	1 of 1 points
Vashya	1 of 2 points
Tara	1 of 3 points
Yoni	1 of 4 points
Graha Maitri	1 of 5 points
Gana	1 of 6 points
Bhakoot	1 of 7 points
Nadi	1 of 8 points

| Varna - 1 of 1 points

Returned for Anaya (fictional) and Dev (fictional): 1/1. This is one weighted Ashtakoot category, not a probability or a measure of either person.

Traditional category: A traditional classification factor, not a measure of a person's social worth or entitlement.

Everyday example, not inferred from the score: For example, relatives may attach different social expectations to a marriage; ask which expectations either person actually accepts.

A question for both people: Which family expectation would you each choose freely, and which would you decline?

| Vashya - 1 of 2 points

Returned for Anaya (fictional) and Dev (fictional): 1/2. This is one weighted Ashtakoot category, not a probability or a measure of either person.

Traditional category: A traditional interaction category. It does not establish consent or a right to control a partner.

Everyday example, not inferred from the score: For example, one person may expect frequent calls while the other needs quiet time. The category cannot decide whose preference should prevail.

A question for both people: What boundaries and contact routines would feel respectful to both of you?

| Tara - 1 of 3 points

Returned for Anaya (fictional) and Dev (fictional): 1/3. This is one weighted Ashtakoot category, not a probability or a measure of either person.

Traditional category: A birth-star relationship factor. It is not an assessment of actual health or financial prospects.

Everyday example, not inferred from the score: For example, an important date can feel reassuring, but it does not substitute for an actual health or travel plan.

A question for both people: Which practical concern needs a direct answer from the appropriate person or professional?

| Yoni - 1 of 4 points

Returned for Anaya (fictional) and Dev (fictional): 1/4. This is one weighted Ashtakoot category, not a probability or a measure of either person.

Traditional category: A symbolic matching category. It does not reveal anyone's actual intimate preferences or wellbeing.

Everyday example, not inferred from the score: For example, comfort with affection must be discussed privately and voluntarily, never inferred from a symbolic label.

A question for both people: Can each person state preferences and limits without pressure?

Graha Maitri - 1 of 5 points

Returned for Anaya (fictional) and Dev (fictional): 1/5. This is one weighted Ashtakoot category, not a probability or a measure of either person.

Traditional category: A traditional comparison involving sign lords, not a measurement of everyday friendship skills.

Everyday example, not inferred from the score: For example, agreeing on a goal does not mean two people interpret a promise in the same way.

A question for both people: What does each person understand by a shared promise such as support or regular visits?

| Gana - 1 of 6 points

Returned for Anaya (fictional) and Dev (fictional): 1/6. This is one weighted Ashtakoot category, not a probability or a measure of either person.

Traditional category: A traditional temperament grouping, not a personality test or mental-health diagnosis.

Everyday example, not inferred from the score: For example, different daily routines can be negotiated even when a traditional category sounds similar.

A question for both people: Which ordinary habit matters to each of you, and what compromise is possible?

Bhakoot - 1 of 7 points

Returned for Anaya (fictional) and Dev (fictional): 1/7. This is one weighted Ashtakoot category, not a probability or a measure of either person.

Traditional category: A relative Moon-sign factor, not a forecast of the couple's family or social future.

Everyday example, not inferred from the score: For example, a move between cities raises concrete housing, work and family-care questions that a Moon-sign factor cannot settle.

A question for both people: Which location and financial arrangements have both people actually agreed to?

| Nadi - 1 of 8 points

Returned for Anaya (fictional) and Dev (fictional): 1/8. This is one weighted Ashtakoot category, not a probability or a measure of either person.

Traditional category: A traditional matching classification. It is not genetic screening, fertility evidence or medical advice.

Everyday example, not inferred from the score: For example, questions about inherited conditions require qualified medical advice, not a matching classification.

A question for both people: Is there a real-world question you should ask a clinician together, with both people consenting?

How the total was assembled

Addition check: $1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 = 8$. Maximum check: $1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 = 36$.

Factors below their own maximum: Vashya (1/2); Tara (1/3); Yoni (1/4); Graha Maitri (1/5); Gana (1/6); Bhakoot (1/7); Nadi (1/8).

This explains the arithmetic, not the probability of a successful relationship. The eight saved factor values printed above are the calculation record for this edition. This arithmetic does not establish predictive accuracy.

Use the discussion questions together

Anaya (fictional) and Dev (fictional): answer independently before comparing answers. These questions come from your

decision, not the factor score.

Your supplied concern is:

Question: What should we discuss before deciding where to live?

- ◆ What would a fair outcome look like to each of us, in our own words?
- ◆ Which shared responsibilities, family expectations and boundaries are still assumptions?
- ◆ What ordinary evidence or qualified advice do we need before a commitment?
- ◆ When will we revisit one unresolved question together?

When a report is not the right tool

Consent, safety and mutual respect are not decided by a chart. Do not use a favourable result to dismiss coercion or a person's wish not to proceed. Do not use an unfavourable result to stigmatise either person.

For persistent conflict, seek an appropriate qualified counsellor if both people want support. If someone feels unsafe, prioritise real-world safety and trusted local help over completing this discussion guide.

CHAPTER 02

What the single matching total conceals

Your total is 8/36. 0 factors have zero awarded points; 1 receive their full individual weight. The largest raw contribution is bhakut: 1 of its own 7 possible points.

The eight factors are not eight equal votes. Their maximum weights range from 1 to 8; the four largest weights together account for 26 of 36 possible points. A change in a high-weight

category can move the total more than changes in several small-weight categories. That weighting belongs to the traditional method, not to a measurement of what matters most to you as a couple.

Different factor patterns can produce the same total. Keep the breakdown when comparing editions; an unchanged total does not prove that every underlying factor stayed the same. Each percentage below describes only that factor's awarded weight, never the chance of a successful relationship.

- ◆ varna: 1/1; 100% of its own weight.

- ◆ vashya: $1/2$; 50% of its own weight.
- ◆ tara: $1/3$; 33.3333% of its own weight.
- ◆ yoni: $1/4$; 25% of its own weight.
- ◆ maitri: $1/5$; 20% of its own weight.
- ◆ gan: $1/6$; 16.6667% of its own weight.
- ◆ bhakut: $1/7$; 14.2857% of its own weight.
- ◆ nadi: $1/8$; 12.5% of its own weight.

CHAPTER 03

Why your factor pattern matters more than a slogan

For Anaya (fictional) and Dev (fictional), the difference from the arithmetic maximum is 28 points. The rows below explain where that difference arises. They do not identify faults in either person and do not claim that every factor should reach its maximum.

The order is by unawarded points, not by human importance. A factor with a maximum of 8 can contribute a larger numerical

difference than a factor with a maximum of 1. This is why a single combined label hides information. A larger gap is not evidence of a greater real-world problem.

Use the actual relationship question as a separate discussion. Do not let a point category answer questions about consent, character, honesty, health or fertility. None of those is measured by these eight returned values.

- ◆ nadi: 1 awarded, 7 unawarded, maximum 8. 25% of this report's total arithmetic gap.

- ◆ bhakut: 1 awarded, 6 unawarded, maximum 7. 21.4286% of this report's total arithmetic gap.
- ◆ gan: 1 awarded, 5 unawarded, maximum 6. 17.8571% of this report's total arithmetic gap.
- ◆ maitri: 1 awarded, 4 unawarded, maximum 5. 14.2857% of this report's total arithmetic gap.
- ◆ yoni: 1 awarded, 3 unawarded, maximum 4. 10.7143% of this report's total arithmetic gap.
- ◆ tara: 1 awarded, 2 unawarded, maximum 3. 7.1429% of this report's total arithmetic gap.

- ◆ vashya: 1 awarded, 1 unawarded, maximum 2. 3.5714% of this report's total arithmetic gap.
- ◆ varna: 1 awarded, 0 unawarded, maximum 1. 0% of this report's total arithmetic gap.

CHAPTER 04

Your saved details and report notes

Your question and next fact appear before Contents. The saved inputs, reading guide and calculation references are collected here so the result stays easy to find. Keep this record when comparing a later edition or asking for an input correction.

In this chapter

How to read this report

A decision you can explain

What this report does not claim

Calculation method and limits

Details used - Anaya (fictional)

Selected person 1: Anaya (fictional). These are the details frozen for this report. Editing your account later does not change this edition.

Birth date, time, place and time-zone settings can change a birth-chart calculation. Name spelling identifies the person; it does not change the saved astronomical positions. Contact support to correct a source detail rather than buying the same report again to report an input error.

- ◆ Date of birth: 1990-06-15
- ◆ Birth time: 08:30
- ◆ Birth place: Kochi; country: India
- ◆ Birth time zone: Asia/Kolkata
- ◆ Current city: Toronto; current time zone: America/Toronto

- ◆ Mother tongue: Not supplied.
Report language: English.

Details used - Dev (fictional)

Selected person 2: Dev (fictional).
These are the details frozen for
this report. Editing your account
later does not change this
edition.

- ◆ Date of birth: 1992-03-18
- ◆ Birth time: 08:30
- ◆ Birth place: Kochi; country:
India
- ◆ Birth time zone: Asia/Kolkata
- ◆ Current city: Toronto; current
time zone: America/Toronto

- ◆ Mother tongue: Not supplied.
Report language: English.

How to read this report

Start with the calculation summary, then the sections relevant to your question.

“Calculated” means a reproducible result from the named method. “Traditional” describes a cultural interpretation, not an established prediction. “Practical” means an optional step you can assess in ordinary life.

A result can be arithmetically correct without proving a claim about the future. A missing calculation is not an unfavourable result. No section asks you to buy a remedy to avoid harm.

A decision you can explain

Choose one fact to confirm next. Write down who can answer it and when you will review the answer. Take a small, reversible step before making a lasting commitment.

The next fact I will confirm:

The person or source I will ask:

My date to review the answer:

What this report does not claim

Astrology and numerology are offered here as cultural and reflective systems. Their interpretations do not establish that a relationship will succeed, a name will create wealth, an illness will occur, or a date will guarantee success. A favourable factor is not permission to ignore evidence. An unfavourable factor is not a reason for fear, stigma or discrimination.

Use qualified medical, legal, financial or counselling support where the decision calls for it. You remain free to disagree with an interpretation and to stop reading.

Calculation method and limits

The eight traditional factor values and weights are printed for both selected people. Factor percentages and angular comparisons, when available, are derived from saved factors and positions. Traditional themes and practical suggestions are editorial explanations. Missing or unconfirmed calculations are

withheld; a printed result does not establish predictive accuracy.

About this public example

FICTIONAL LAYOUT SAMPLE.

Names, birth details, chart positions, scores, and dates below are invented for display testing. They are not an independently calculated personal report or a prediction.

CHAPTER 05

Your report, in everyday words

The saved Ashtakoot score for Anaya (fictional) and Dev (fictional) is 8 out of 36 traditional points.

This compares eight chart factors; it is not the chance that a relationship will last. nadi received 1 of 8 points; varna received 1 of 1. The earlier table explains each factor.

In this chapter

What those words mean

How the findings fit together

An everyday example

A useful next step and the limits

What those words mean

A low factor records how one rule classified birth details; a high factor records another rule. Neither measures trust, safety or shared plans.

Zero does not foretell harm, and a full score cannot override a serious concern. People are more than chart categories.

How the findings fit together

Read nadi beside varna, rather than treating 8 as a verdict. Ask whether either birth detail is uncertain.

Then compare the two people's daily needs and hopes. These may matter more to a real choice than a point difference.

| An everyday example

Illustration, not a statement about this pair: two people may score highly yet disagree about where to live.

They could each name one non-negotiable and one possible compromise. A lower score cannot tell us whether they will resolve that question kindly.

A useful next step and the limits

Ask each person what matters, without pressure. Discuss routines, consent, money and family expectations. "Koot" means one factor in this point system, not a personality test.

A score cannot decide compatibility or consent. Both people can disagree with the reading.

Save your own report

Your own purchased report appears in My Granths. This public example contains no personal reading or purchase entitlement.

Fictional public example. Not a personal prediction.
